

Management of Orbital & Periocular Vascular Anomalies

Maher Assem, FRCSEd
Consultant Oculoplastic Surgeon
Egypt

Orbital Vascular Lesions

Vascular Tumours

- cellular Proliferation
- = Infantile Hemangioma
- = Congenital „
- = Hemangiopericytoma
- = Hemangioblastoma

Vascular Malformation

- abnormal channels
- 1) High Flow (AV Malformation)
 - Intra. Trans. Or Periorbital
 - 2) Mixed flow
 - AV Fistula
 - 3) Low flow

* Venous Malformation VM

- = Distensible
- = Non-distensible (cav. VM)

* Lymphatic Malformation LM

Macrocystic, Microcystic, Mixed

* Combined LVM.

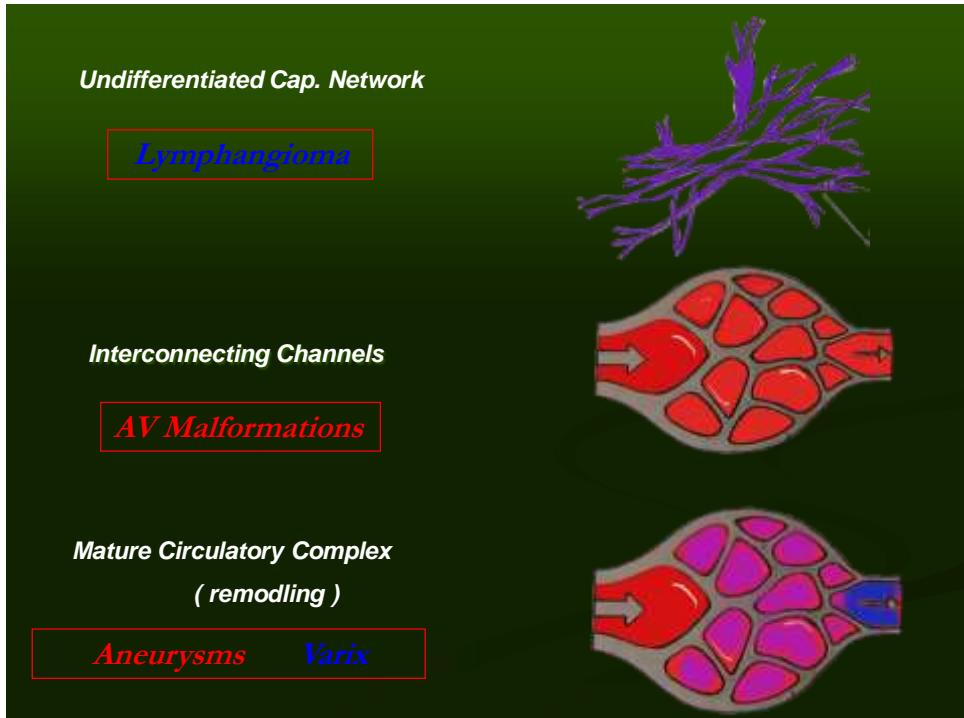

**ISSVA, 1999 uses
Orbital Society**

**Consensus
Statement.**

Understanding Haemodynamics & Pathophysiology

Cellular Components of BVs

- Endothelial Cells
- Smooth Muscle Cells
- Pericytes

Assessment of Flow Dynamics

- **History**
- **Exam.**
 - Inspection (e or e out Valsalva)
 - Palpation
 - Auscultation
- **Imaging**
 - Non Invasive (Doppler U/S, CT, MRI, contrast ,CTA, dynamic MRA, MRV)
 - Invasive (Digital Subtraction Angiography **AVM**)

Inspection (Orbital Varix)

Speed of Inflation & Deflation

+++ / +++

++ / ++

Palpation

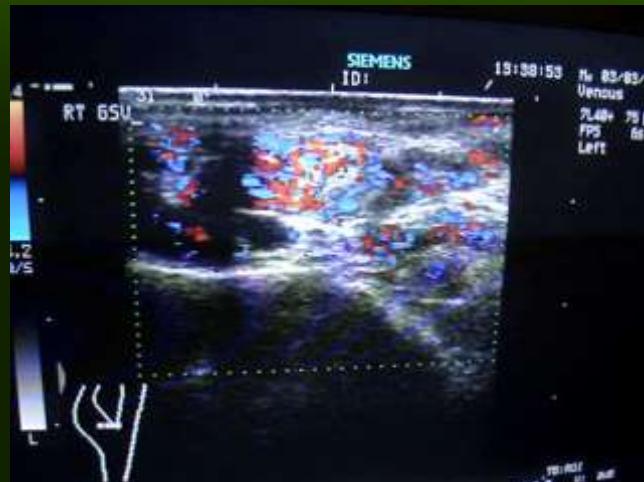

Assessment of Flow Dynamics

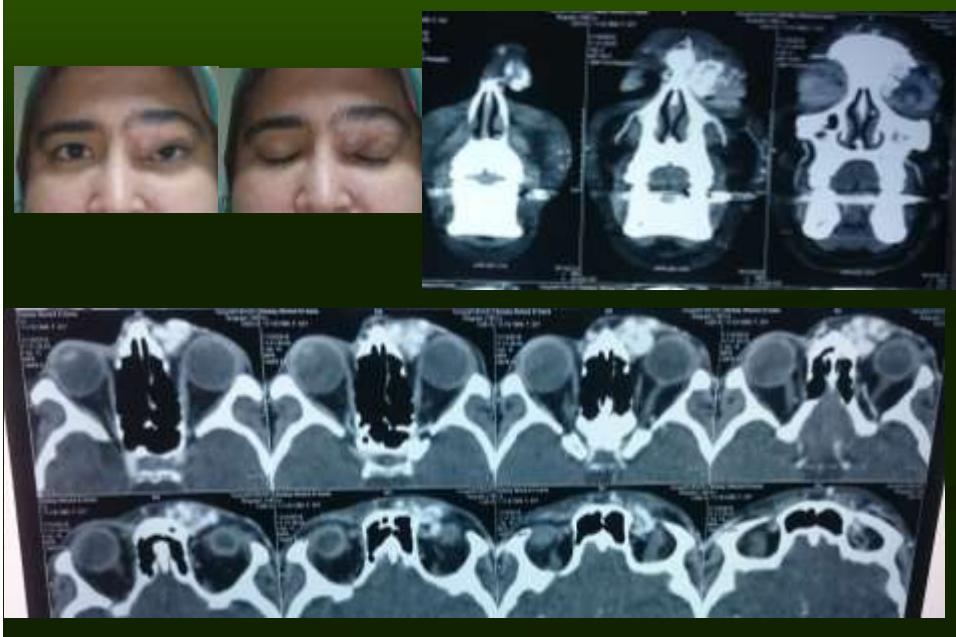

- History
- Exam.
 - Inspection (e or e out Valsalva)
 - Palpation
 - Auscultation
- Imaging
 - Non Invasive (Doppler U/S, CT, MRI, contrast ,CTA, dynamic MRA, MRV)
 - Invasive (Digital Subtraction Angiography **AVM**)

Doppler Ultrasonography

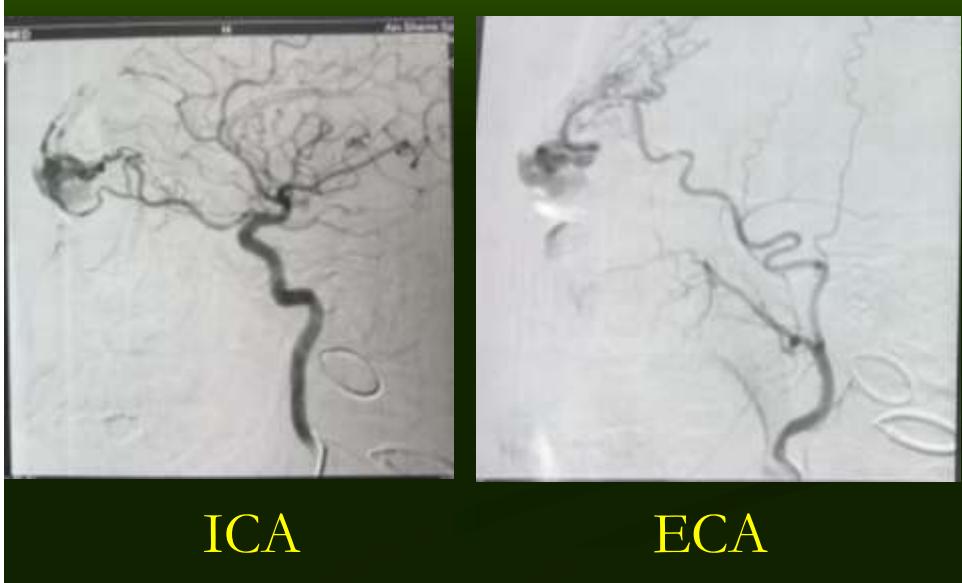

AV Malformations

DP-MDCTA

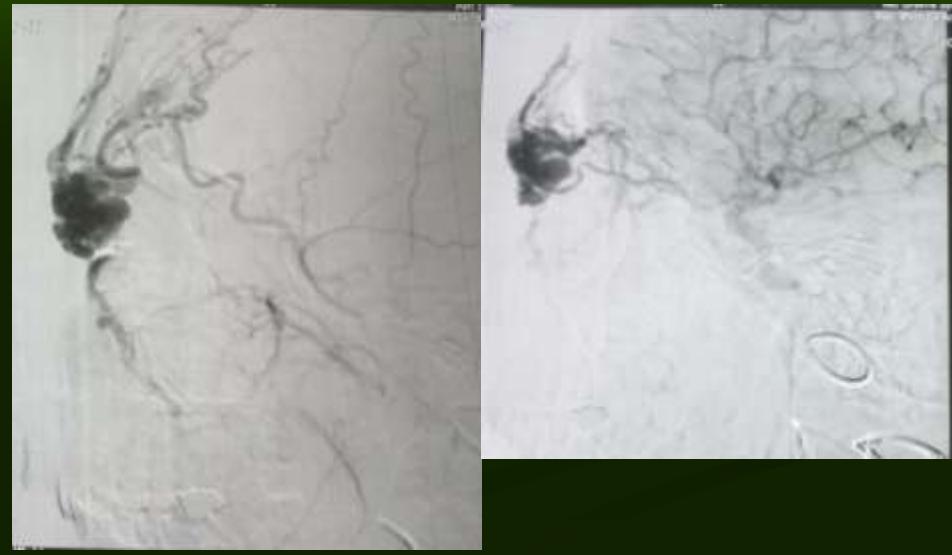

Digital Subtraction Angiography

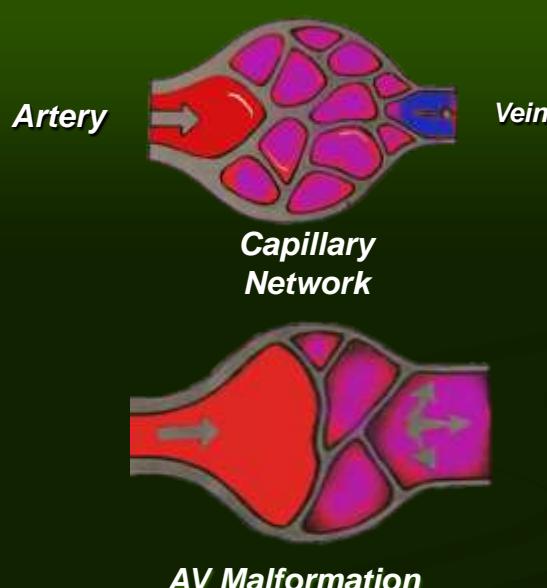

Digital Subtraction Angiography

Cases

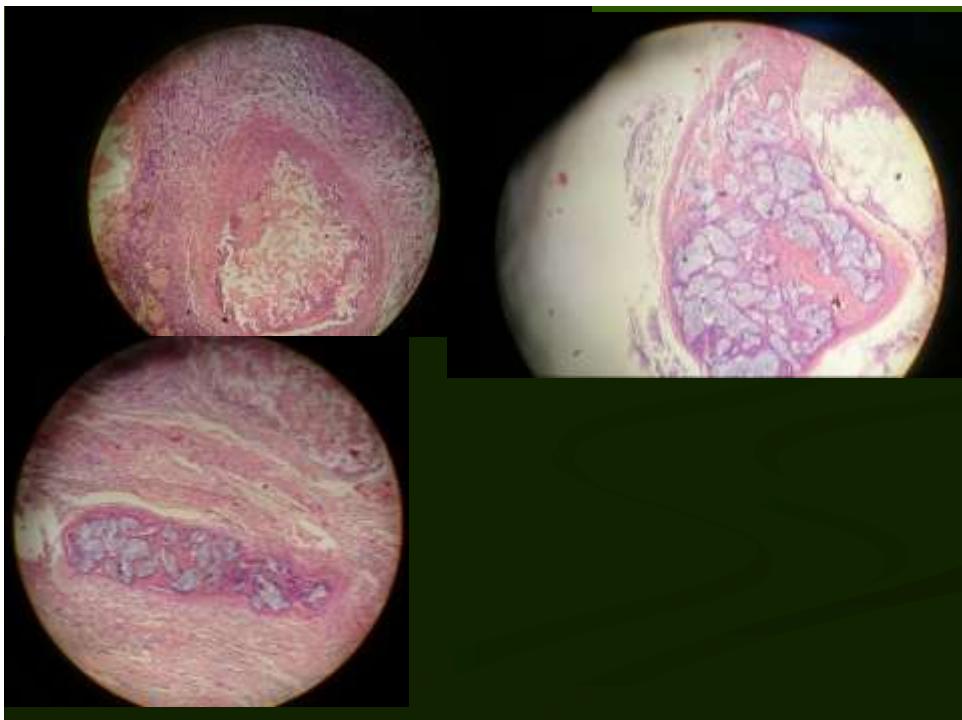

Orbital Vascular Lesions

- Vascular Malformation
 - abnormal channels
 - 1) **High Flow** (AV Malformation)
 - Intra. Trans. Or Periorbital
 - 2) **Mixed flow**
 - AV Fistula
 - 3) **Low flow**
 - * Venous Malformation VM
 - = Distensible
 - = Non-distensible (cav. VM)
 - * Lymphatic Malformation LM
 - Macrocystic, Microcystic, Mixed
 - * Combined LVM.

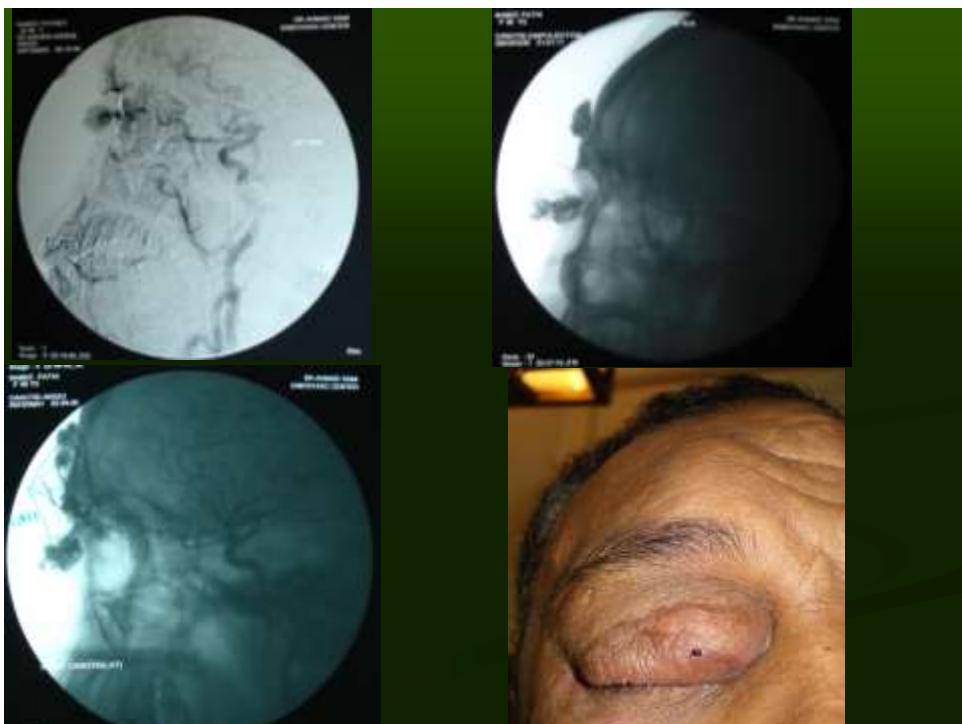

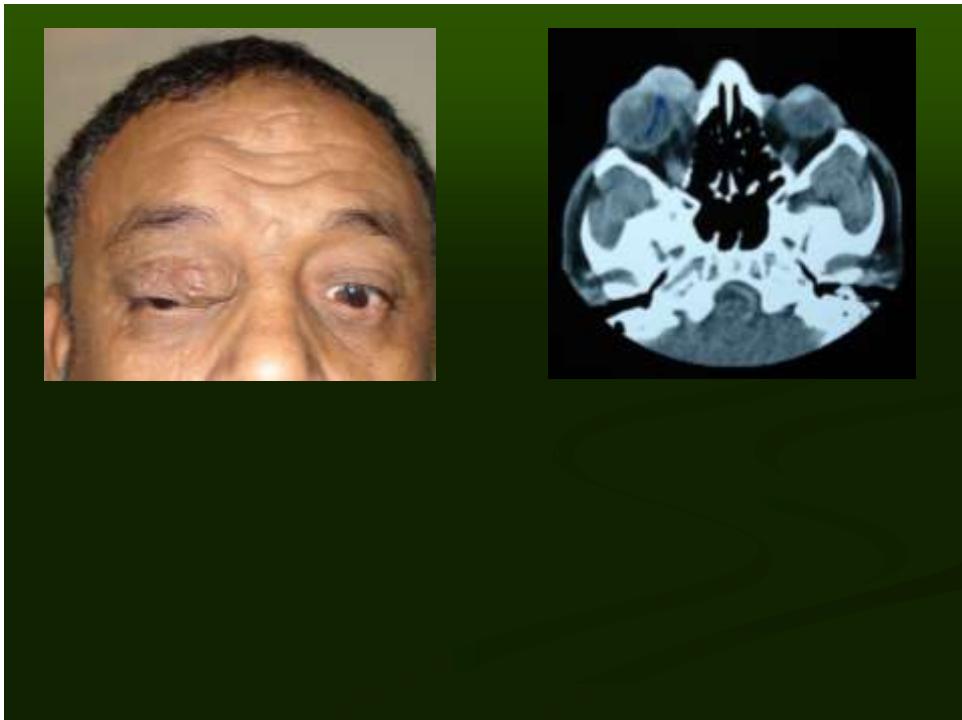

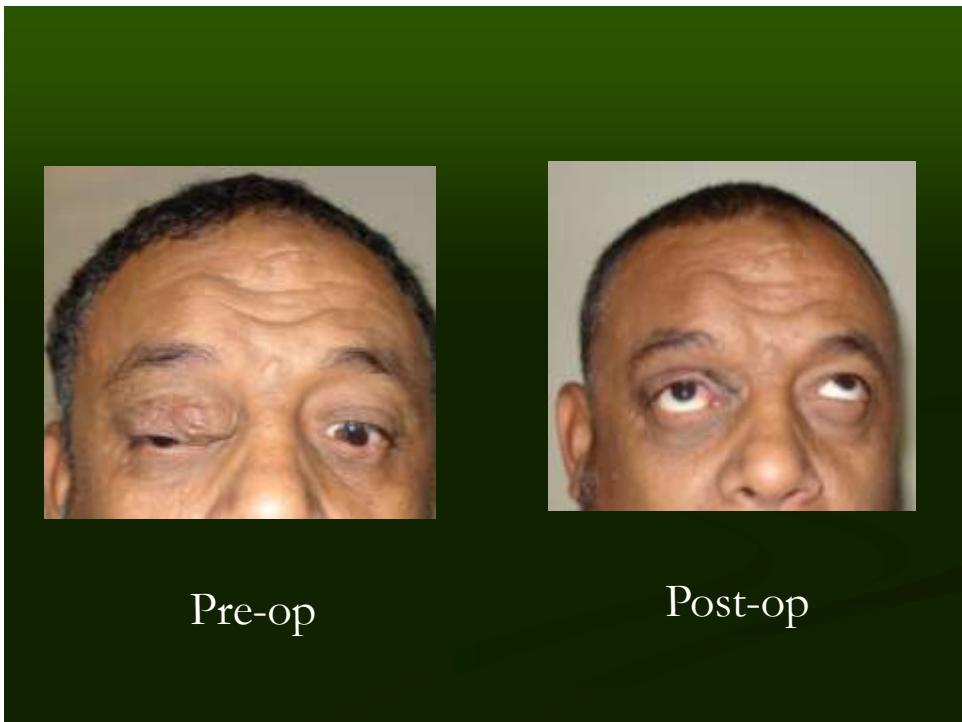

High Flow AVM

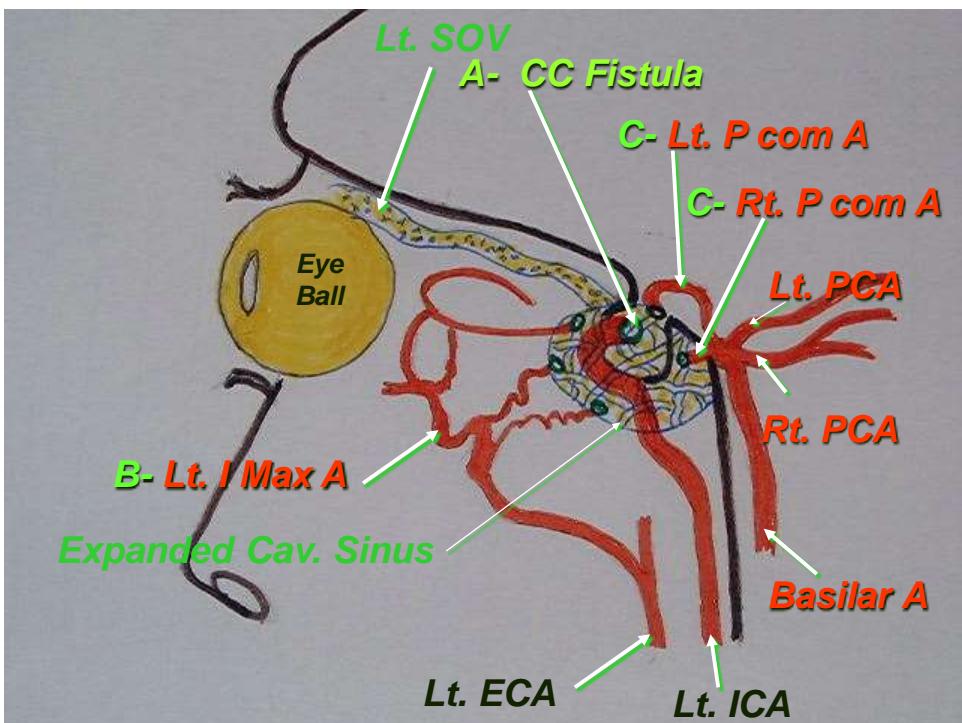

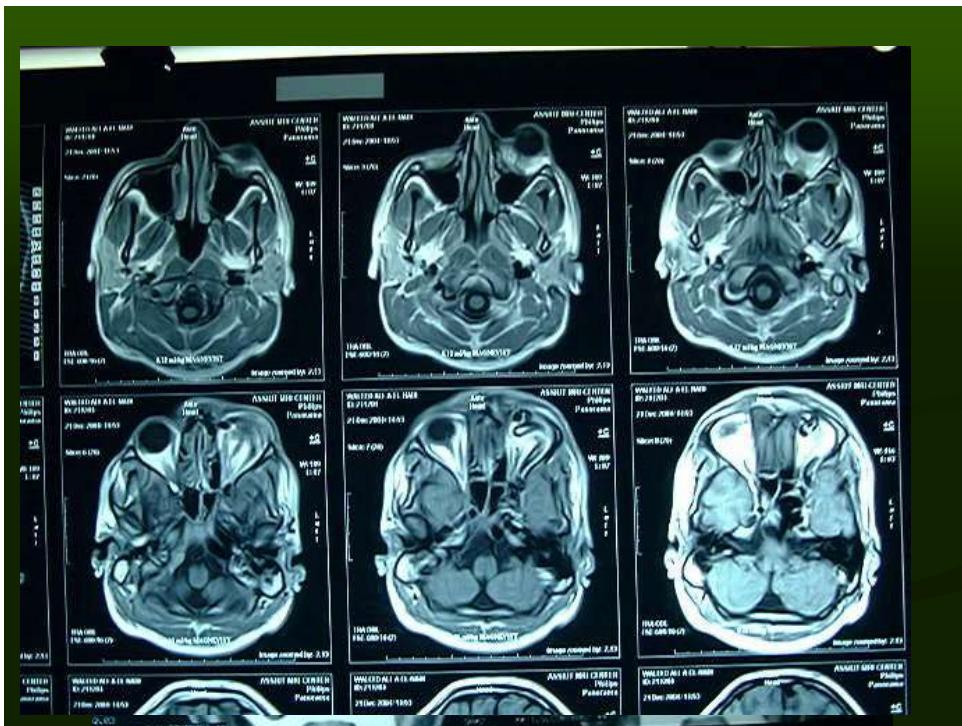

Pre-op

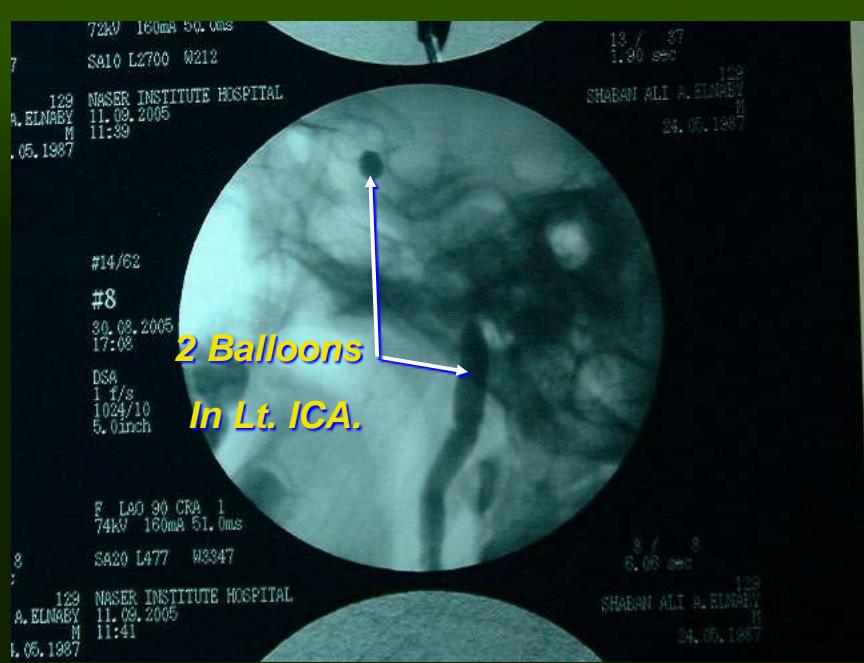

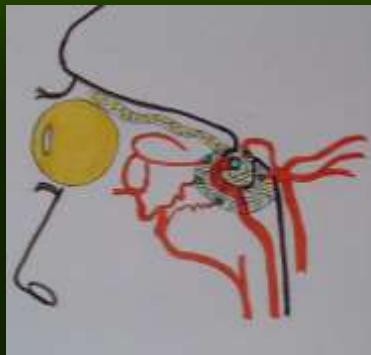

Post-op

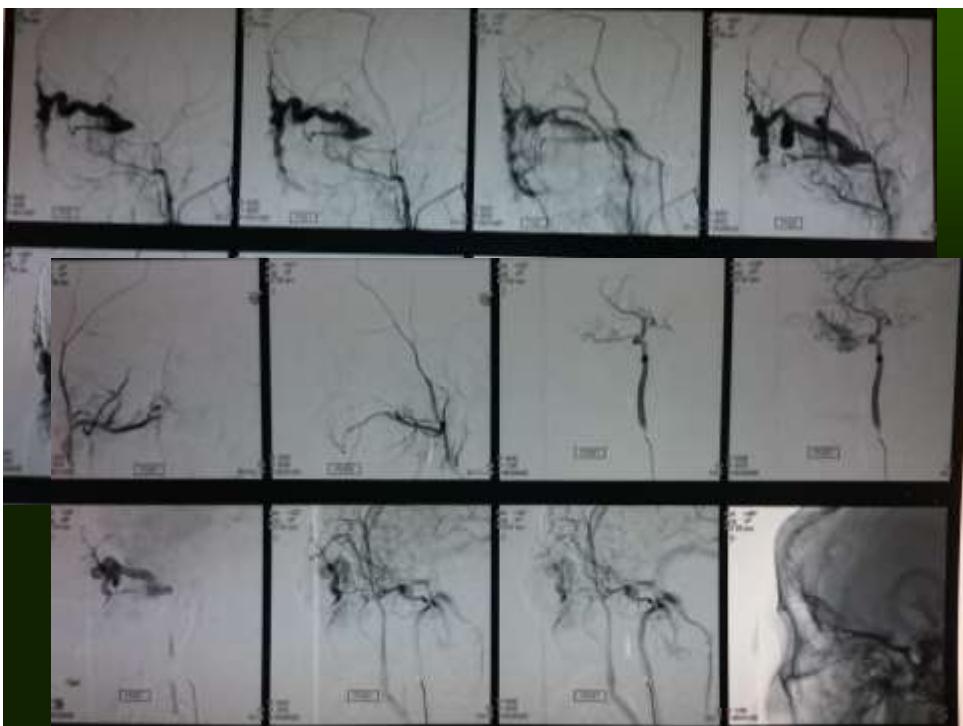

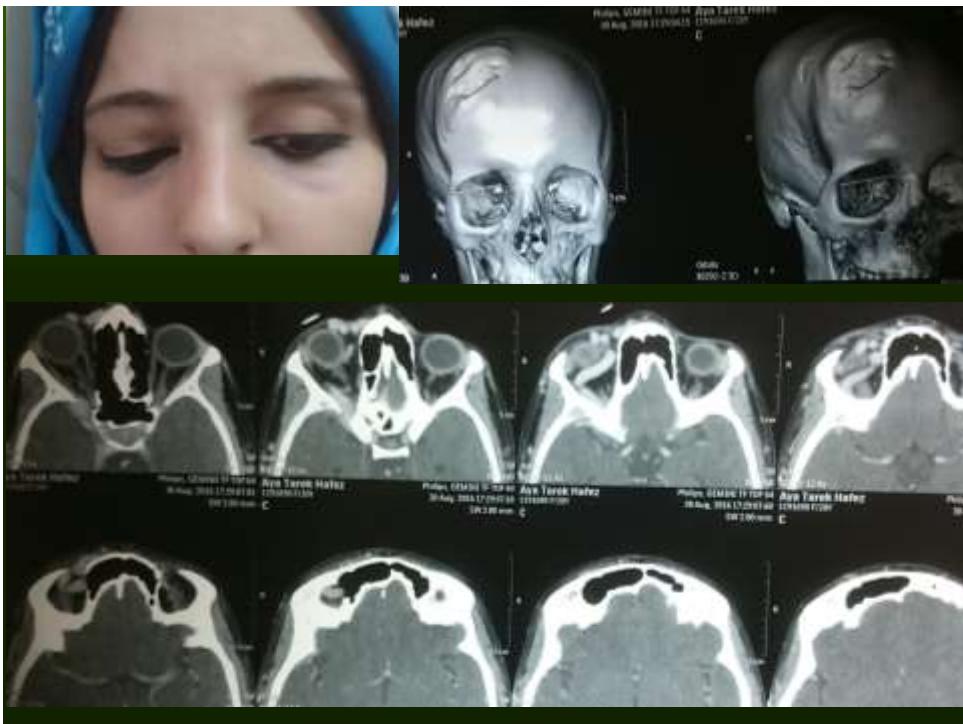

Mixed Flow (AV Fistula)

ICA. Balloon

III – Low Flow Malformation

Lymphatic Malformation

■ Microcystic LM

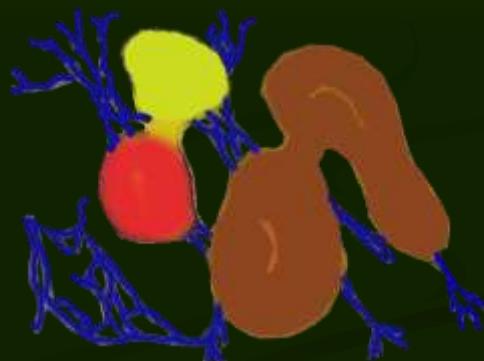

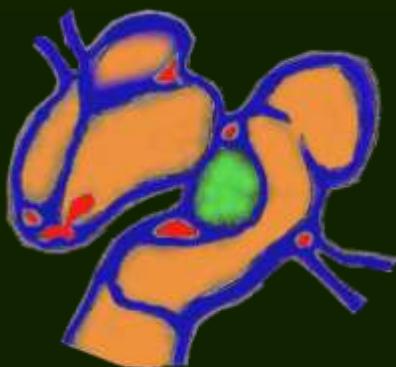

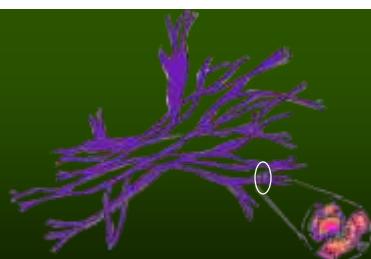

- < 2 cm
- Solid
- Infiltrative lesions
- Found more anteriorly
- More prone to rec. hge

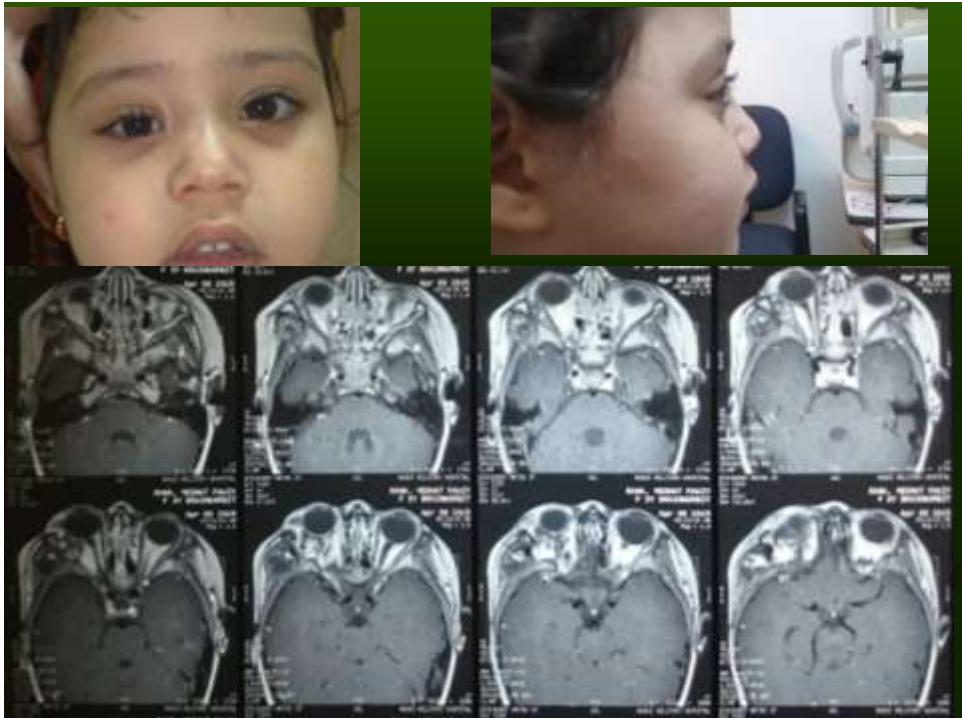

■ Macrocystic LM

- > or = 2 cm
- Fluid – fluid level
- Intraconal space
- More stable

Lymphatic Malformation

Lymphangioma

Evalon (Poly vinyl Alcohol sponge)

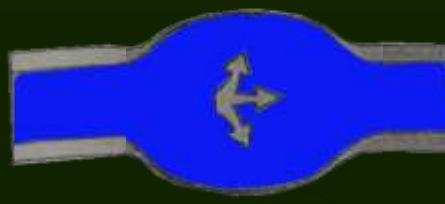

- * Observation
- * Surgical debulking
Hge , Chocolate cyst ----
- * Macrocystic --- U/S guided
Aspiration
+ Bleomycin A5
or Doxycycline injection

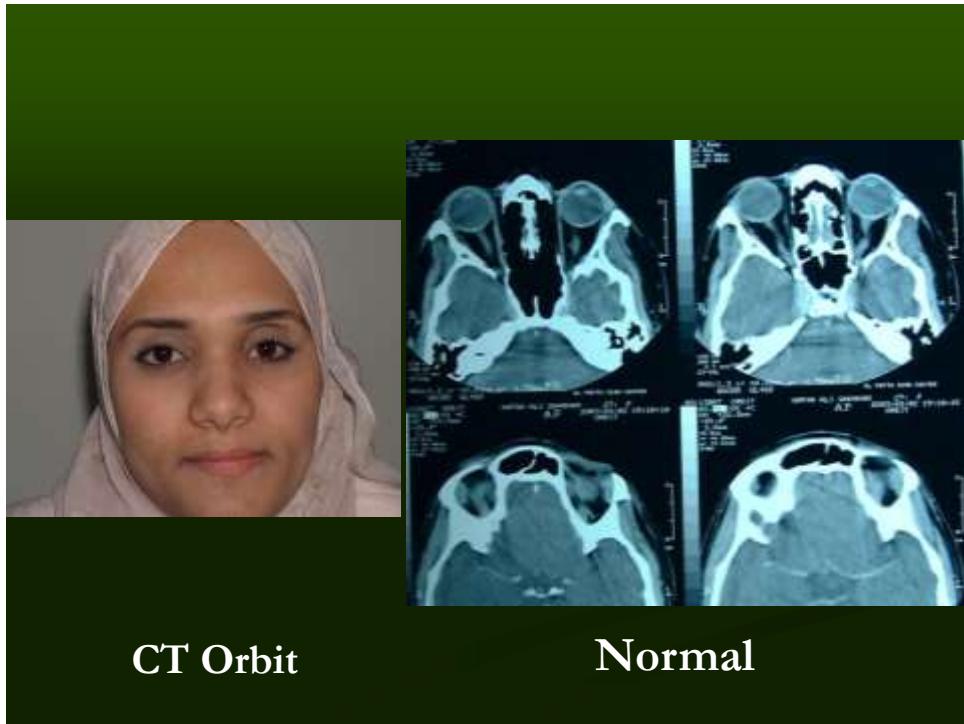

Pre-operative and post-operative photographs of a patient with a macrocystic eyelid lesion.

Venous Malformation

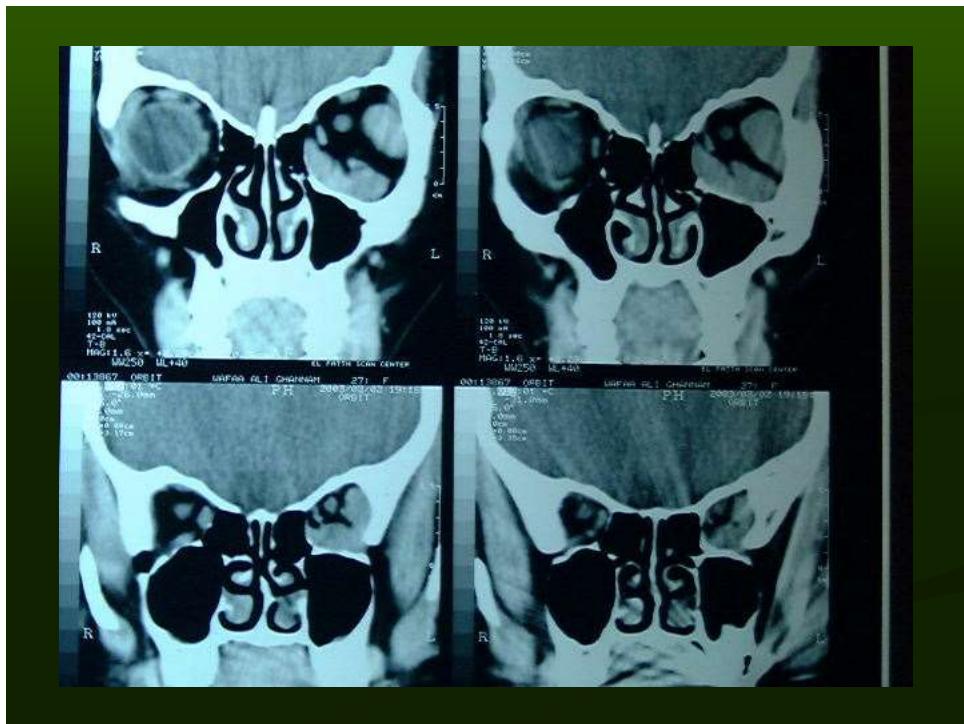

Primary Varices

CT Orbit

Normal

Orbital Vascular Lesions

Vascular Tumours

cellular Proliferation

Improving Management Outcome in Orbital Vascular Lesions

- Understanding
- Brave enough // Wise enough
- Cooperation with others

Neoplasms

*Cap. H. Rapid enlargement →
Spontaneous involution*

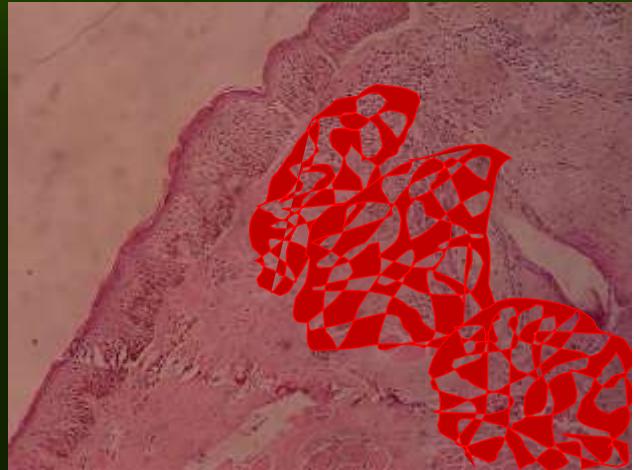

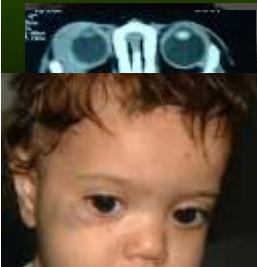

North et al. in 2001 (Arch Dermatol)

*their vascular endoth. expressed placental
associated Ags. not expressed by control tissues.*

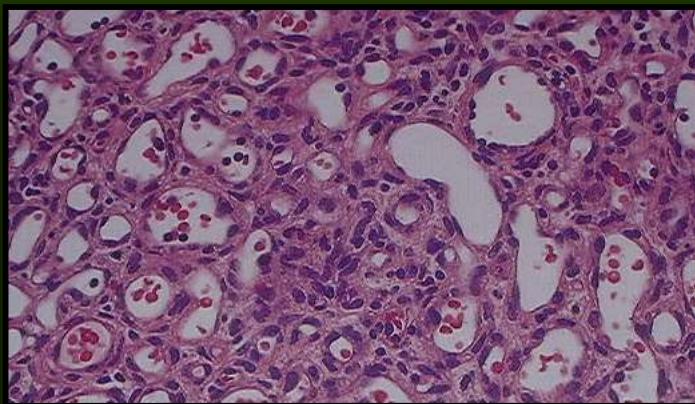

GLUT-1 (Glucose transporter molecule)

→ CH in infants could be sequestered tissue of
placental origin that grows rapidly due to the post-
natal escape from the intrauterine factors controlling
placental growth.

Capillary Hemangioma

Capillary Hemangioma

Treatment

None could be administered without risk.

- Observation
- Corticosteroids (Oral, Intralesional, Perilesional, Topical)
- Lasers (Dye, YAG, CO₂)
- Radiation
- Interferon
- Surgical dissection

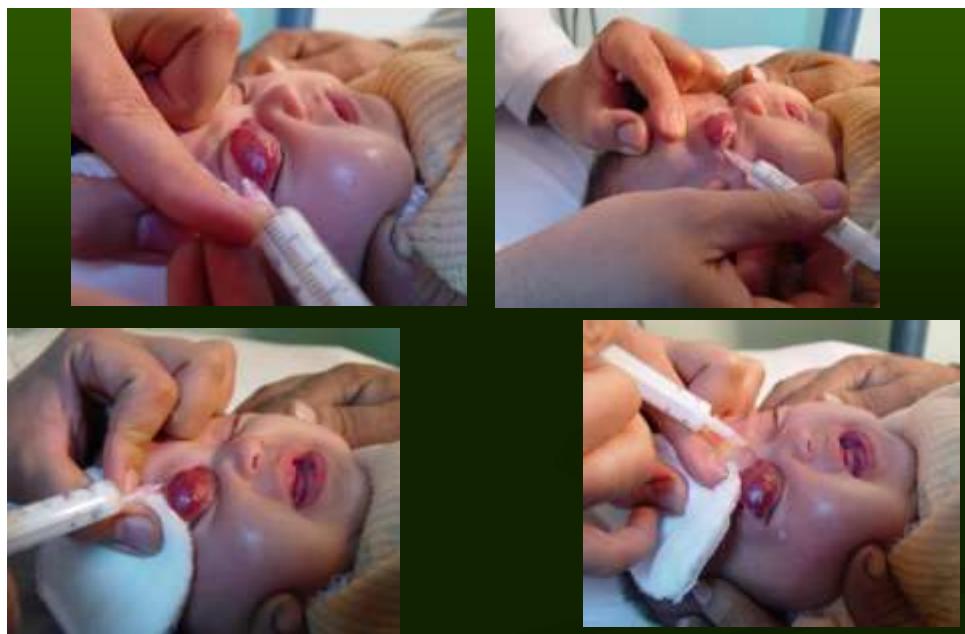

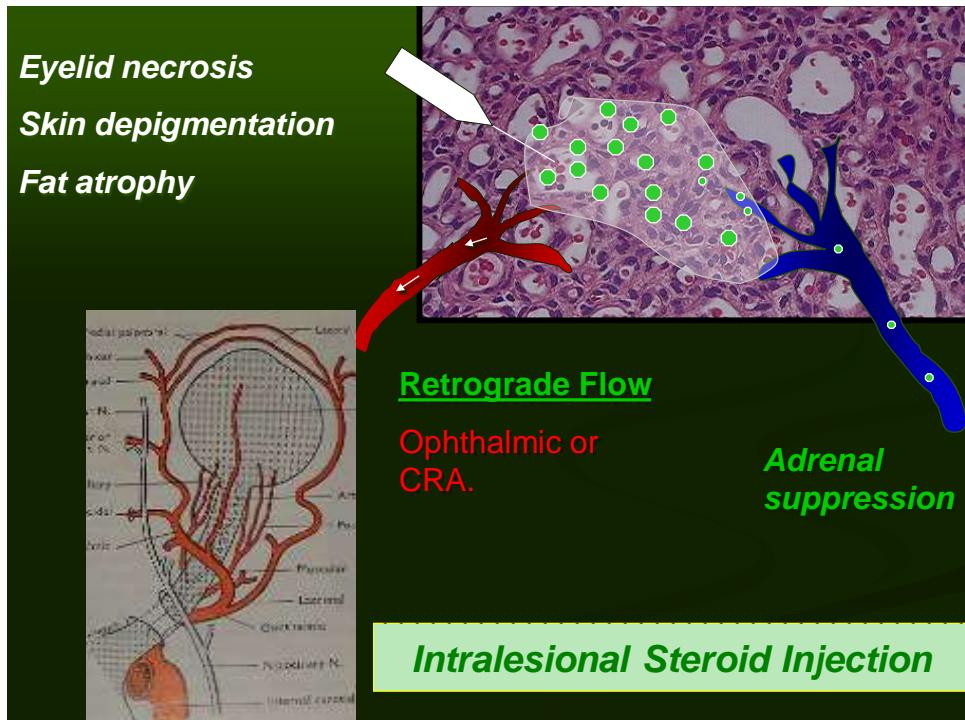

Intralesional corticosteroids

Triamcinolone 1ml (40mg / ml) +

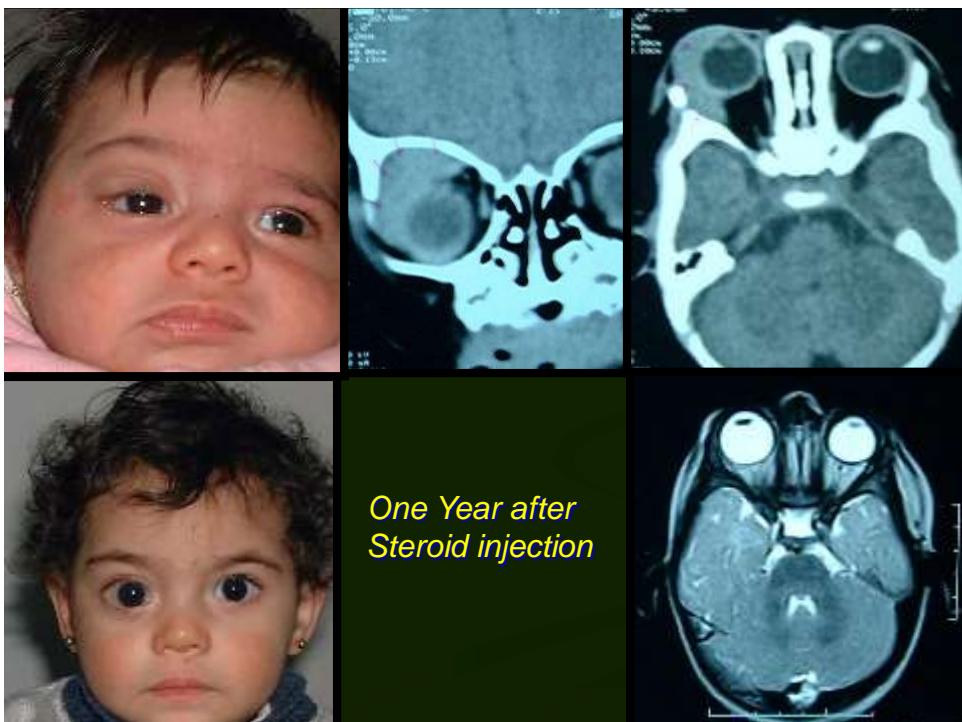

Betamethasone 1ml (6mg / ml)

Kushner, 1977

Periorbital Hemangioma, EOS March, 2005.

Topical Steroids

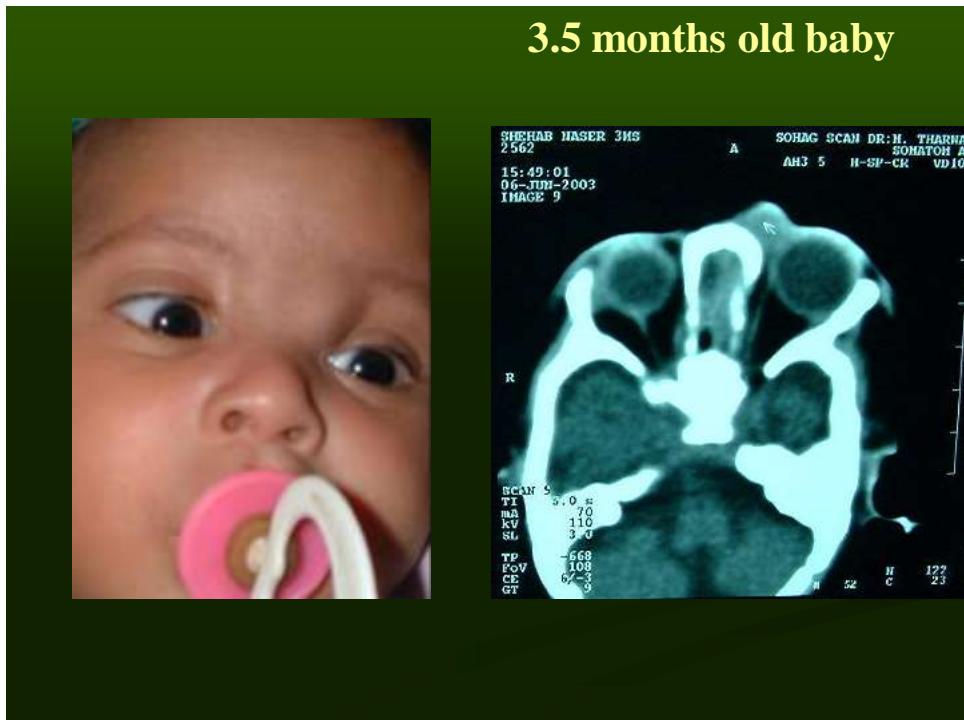

**Clobetason Propionate
0.05 mg/ml
(Dermovate)**

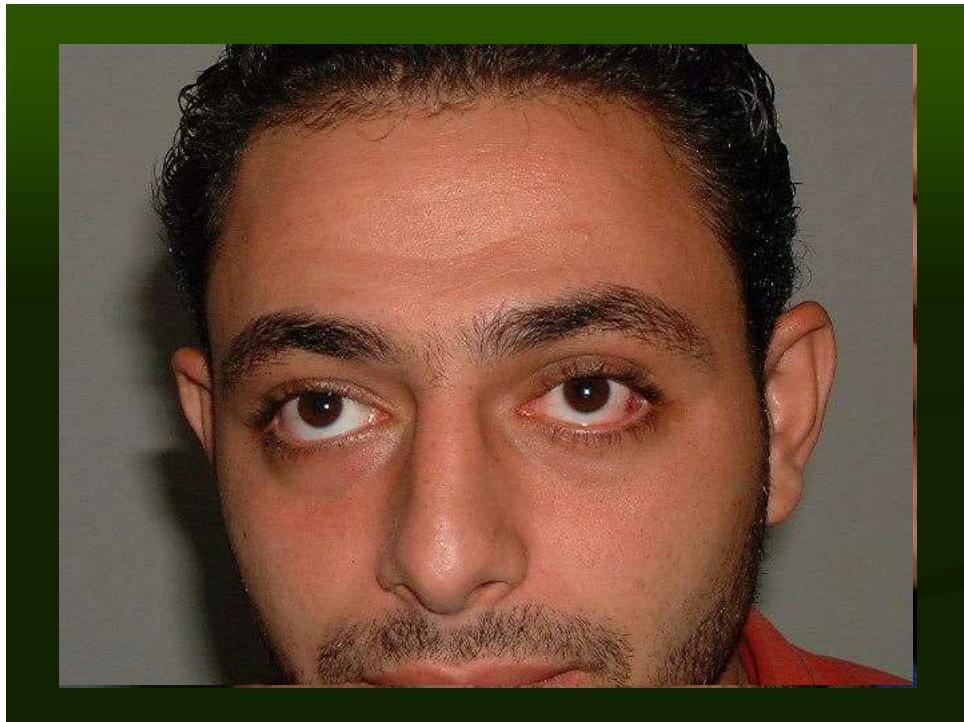

Intervention

Surgery

Interventional Neuro-radiology

3.5 months old baby

Hemangioendothelioma

CD - 34^{+ve}
